

Delinquency_prediction_dataset

KEY INSIGHT

- Customers with **high credit utilization** (>70%) and **high debt-to-income ratios** (>0.4) are most at risk.
 - **Lower credit scores** (<450) and **prior missed payments** strongly predict future delinquency.
 - **Early-month late payments** (Month_1_Late, Month_2_Late) are red flags for upcoming account delinquency.
 - **XGBoost** outperforms others, suggesting that non-linear interactions between risk factors are important.
